Introduction

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Mridul Verma
[10415]
Mohd.
Dawood
[10327404]
Supervisor :
Dr. Phalguni
Gupta

- Automatic matching of free-form linear features is a groundbreaking problem to solve because of its applications in 3-D reconstruction problem.
- We tried to implement one of the older algorithms to incorporate the concepts of parallelization in sequential algorithms.

Problem Statement

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Mridul Verma

Dr. Phalguni
Gupta

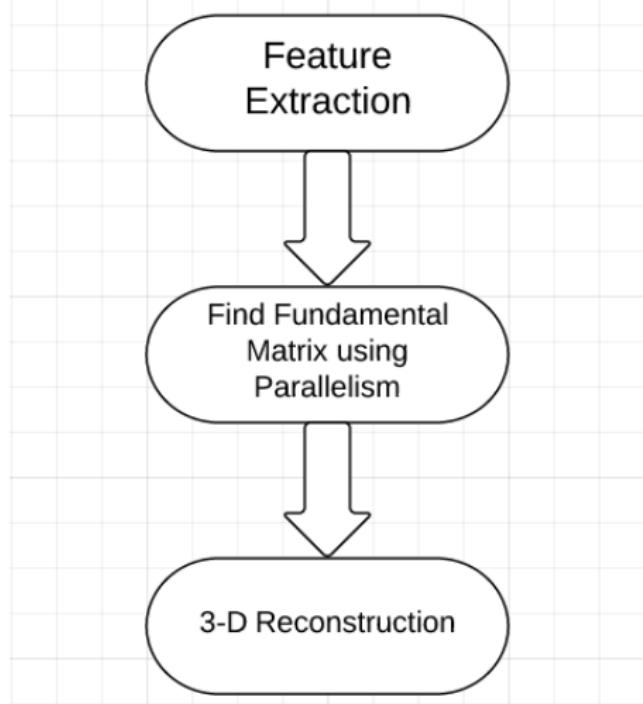

Given a pair of images, we have to do the following :

- Calculate the **Fundamental matrix.**
 - It defines the relationship between the stereo pairs.
- Perform 3-D reconstruction using that matrix.

Our Approach

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Gupta

- SIFT(Scale Invariant Feature Transform) is used as the feature extracting algorithm to extract feature points for the two given images.
- These features are invariant to image translation, scaling and rotation.
- This invariance is due to the difference fo Gaussians function applied to scale space to a series of smoothed and resampled images.
- These features are quite robust and more stable for image matching and recognition.

Feature Extraction (SIFT)

Automatic
Matching and
3-D Recon-
struction of

Supervisor :
Dr. Phalguni
Gupta

- Feature points from both the stereo images form the respective keypoints set.
- These keypoints are used to calculate the entities of **fundamental matrix**.

Finding Fundamental Matrix

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Mridul Verma
[10415]
Mohd.
Dawood

Supervisor :
Dr. Phalguni
Gupta

- Fundamental matrix defines a relationship between the pair of stereo images.

$$x'^T F x = 0$$

- x' and x are the conjugate points on the left and right stereo images respectively.
- Fx corresponds to the epipolar line on which x' on the other image should lie.

Parameter Calculation

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Mridul Verma
[10415]
Mohd.
Dawood
[10327404]
Supervisor :
Dr. Phalguni
Gupta

- One parameter is calculated at a time.
- Randomly initialize the matrix.
- Take every possible pair of matching hypotheses (every pair of points : one from keypoint_1 and one from keypoint_2).
- For every pair of matching hypotheses, we calculate a particular parameter of the fundamental matrix.
- Now for every pair of matching hypotheses, we obtain a value and check to what bin of the accumulator array does it belong.

Parameter Calculation

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Mridul Verma
[10415]
Mohd.
Dawood

Supervisor :
Dr. Phalguni
Gupta

- After taking every matching hypotheses into consideration , take the bin with the max number of elements in the accumulator array.
- All those matching hypotheses who contribute to that accumulator array , are considered as possible matches and the value of the accumulator array is assigned to the parameter.
- In this way we solve for every parameter of the fundamental matrix and also get the possible matches for the stereo images.

Parallelism

Automatic
Matching and
3-D Recon-
struction of

Gupta

- One dimensional block.
- Block Size = 256
- Number of blocks = $\frac{n_1 \times n_2}{256}$
 - n_1 and n_2 are the number of elements in repetitive keypoint sets.
- Index i and j are defined as follows for their repetitive sets :
 - $i = idx \bmod n_1$
 - $j = (int) \frac{idx}{n_1}$
- The set of variables is calculated in parallel.

Parallelism

Supervisor :
Dr. Phalguni
Gupta

- Using them another **intermediate matrix** is calculated that is then further used to calculate the **fundamental matrix**.
- The structures copied on the **device memory** include :
 - KeyPoint Arrays
 - Array to store the variables.
 - An intermediate array to store the intermediate values.
 - Some Variables.

3-D Reconstruction

Automatic
Matching and
3-D Recon-
struction of
Free-Form
Linear
Features from
Stereo Images

Mridul Verma
[10415]
Mohd.
Dawood
[10327404]
Supervisor :
Dr. Phalguni
Gupta

- Obtain the fundamental Matrix.
- Compute the **Essential Matrix** and then compute the **rotation and translation matrix** (matrix describing the orientation between the two cameras).

- Essential Matrix :

$$E = K' T.F.K$$

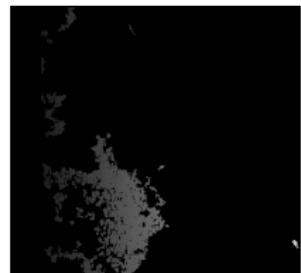

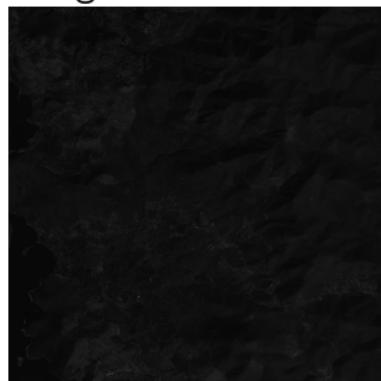

- More general form of fundamental matrix as essential matrix can only be used in relation to calibrated cameras since inner camera parameters must be known.
- Then we use the inbuilt functions to obtain the disparity map of the stereo images.
